

JojoNet Fixed v1.1.0

Iran <-> F

1. Overview

JojoNet Fixed is a hardened Bash CLI for building GRE, TUN/TCP, Paqet and VXLAN tunnels between an Iran VPS and a foreign VPS. Iran side can DNAT ports with nftables. Persistence uses systemd units and jojonet-boot.

2. What was fixed

- Config files are parsed safely (never sourced as shell)
- Third-party binaries verified with SHA256 checksums
- TUN overlay uses private 10.30.x.x (not public 30.10)
- Advanced GRE uses pair-hash subnet like Quick GRE
- rp_filter is not disabled globally by default
- GOMAXPROCS fixed for Paqet (was 0, now 1)
- Role override without GeoIP
- Key export/import without root SSH
- Healthcheck command and menu
- Uninstall script
- Safer local installer (prefer package over curl|bash)

3. Install

- 1) Extract JojoNet-Fixed-v1.1.0.zip
- 2) cd JojoNet-Fixed
- 3) sudo bash install.sh
- 4) sudo jojonet --help

Verify only: sudo bash install.sh --verify

4. Tutorial - Quick GRE

On FOREIGN server first:

```
sudo jojonet
```

Choose 1) Quick GRE Tunnel

Enter Iran public IP

On IRAN server:

```
sudo jojonet <FOREIGN_PUBLIC_IP>
```

Subnet ID and GRE key are derived from the IP pair automatically.

Optional MTU probe: JOJONET_QUICK_PROBE_MTU=1

5. Tutorial - TUN/TCP

Use when GRE is blocked:

```
sudo jojonet --tun-tcp <PEER_IP>
```

Key sync options:

- A) SSH root@peer (if available)

B) Manual export/import:

```
sudo jojonet --export-keys <PEER> /root/k.tar.gz  
# copy file to other server  
sudo jojonet --import-keys <PEER> /root/k.tar.gz
```

6. Tutorial - Paquet

Good for filtered / high-latency paths:

```
sudo jojonet --paquet <PEER_IP>
```

Pin version: JOJONET_PAQET_CORE_VERSION=v1.0.0-alpha.16

If checksum missing once:

```
sudo JOJONET_ALLOW_UNSIGNED=1 jojonet --paquet <PEER>
```

Then add printed sha256 into /etc/jojonet/checksums.sha256

7. Tutorial - VXLAN

UDP overlay when GRE blocked but UDP works:

```
sudo jojonet --vxlan <PEER_IP>
```

8. Role detection

Auto via ip-api.com country code.

Force role:

```
export JOJONET_ROLE=iran  
# or  
sudo jojonet --role kharej --peer <IP>
```

9. Health and manage

```
sudo jojonet --health <NAME>
```

Menu 6 = manage / restart / delete / boot

Menu 7 = network status

Menu 9 = healthcheck

Menu 10 = export/import keys

Logs: journalctl -u jojonet@NAME -u jojonet-boot

10. Uninstall

```
sudo jojonet-uninstall
```

or from package:

```
sudo bash uninstall.sh
```

11. Environment variables

```
JOJONET_ROLE=iran|kharej
```

```
JOJONET_ALLOW_UNSIGNED=1
```

```
JOJONET_DISABLE_RP_FILTER=1
```

```
JOJONET_QUICK_PROBE_MTU=1
```

```
JOJONET_PAQET_CORE_VERSION=...
```

```
JOJONET_STEALTH=1
```

```
JOJONET_CLEAR_HISTORY=0
```

12. Security notes

Tool requires root by design.

Prefer local install.sh over curl|bash.

Keep /etc/jojonet mode 700.

Prefer key export/import over opening root SSH.

Do not leave JOJONET_ALLOW_UNSIGNED=1 on production.

13. Troubleshooting

- GeoIP fail: set JOJONET_ROLE
- Checksum fail: pin hash or allow unsigned once
- GRE blocked: try TUN/TCP or VXLAN
- Subnet mismatch: both sides must use same Subnet ID
- After reboot: ensure jojonet-boot enabled (Manage menu)
- Templates: sudo jojonet --refresh-templates

14. Persian quick guide (transliterated)

Nasb: cd JojoNet-Fixed && sudo bash install.sh

Shoroo: aval server kharej, bad Iran ba IP kharej

Naqsh dasti: export JOJONET_ROLE=iran

Kelid bedoon SSH: --export-keys / --import-keys

Salamat: sudo jojonet --health NAME

Hazf: sudo jojonet-uninstall

Matn Farsi kamel dar README.md

15. CLI cheat sheet

sudo jojonet

sudo jojonet <PEER_IP>

sudo jojonet --tun-tcp <PEER>

sudo jojonet --paqet <PEER>

sudo jojonet --vxlan <PEER>

sudo jojonet --role iran|kharej ...

sudo jojonet --health <NAME>

sudo jojonet --export-keys <PEER> [FILE]

sudo jojonet --import-keys <PEER> <FILE>

sudo jojonet --refresh-templates

sudo jojonet-uninstall
